Deploying Electrolytic Hydrogen for Green Ammonia Plants

AEA Conference 2024 Electrolysis Session November 13, 2024

Elliot Wingate Business Development Manager <u>ewingate@nelhydrogen.com</u>

Almost a century of electrolyzer innovation in Norway

- Nel's history begins in 1927 when Norsk Hydro, Nel's parent company, started testing its first electrolyzer
- Hydro also built the world's two largest hydrogen production plants: Rjukan (167 MW) and Glomfjord (135 MW)
- The electrodes manufactured at Herøya today are a further improvement of Hydro's technology
- The facility at Herøya was the world's first fullyautomated electrolyzer facility
- At the research center in Notodden we are developing next-generation pressurized alkaline electrolyzers

Decades of experience in the US

- Nel has been present in the US for 27 years, developing PEM electrolyzers
- Proton OnSite, which was acquired by Nel in 2017, originally utilized the PEM technology to produce oxygen for submarine life support
- Now, Nel and its technology partner, General Motors, are developing the next-generation PEM technology, improving price performance and efficiency
- Nel is also planning a gigafactory in Detroit to produce next-gen alkaline and PEM electrolyzers (FID not yet taken)

A technology leader on two platforms

Provides flexibility and positions Nel for growth in different market segments around the world

Strong field know-how and manufacturing capacity

PEM water electrolysers Wallingford, USA

Systems delivered: 2,700+ Nameplate capacity: **500 MW/year** Experience: ≈**25+ years**

Alkaline water electrolysers 🤳 💻 Notodden/Herøya, Norway

850+ 1000MW/year \approx 95+ years

 \rightarrow 1GW by 2024, Expandable to 2GW/y

NORWAY PRODUCTION UPDATE

The world's first fully-automated electrolyzer manufacturing plant

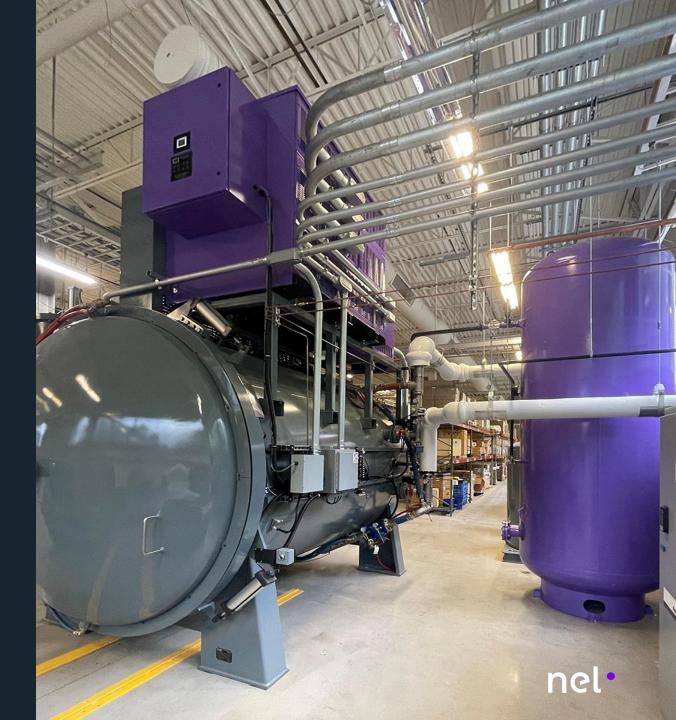

- Construction of the second 500 MW atmospheric alkaline production line at Herøya is completed
- Nel currently has 1 GW of real, fully automated production capacity for atmospheric alkaline electrolyzers at its disposal
- Nel's automated manufacturing concept can be applied anywhere in the world and is critical to being able to scale up electrolyzer production

US PRODUCTION UPDATE

PEM capacity increase on schedule

- The production capacity increase to 500 MW annually for PEM electrolyzers in Wallingford (CT) is progressing according to plan
- All major production steps will be optimized and automated, some previously outsourced processes will also be insourced
- Committed investment CAPEX to completion for the expansion is ~ \$30M.

Nel plans gigafactory in Michigan

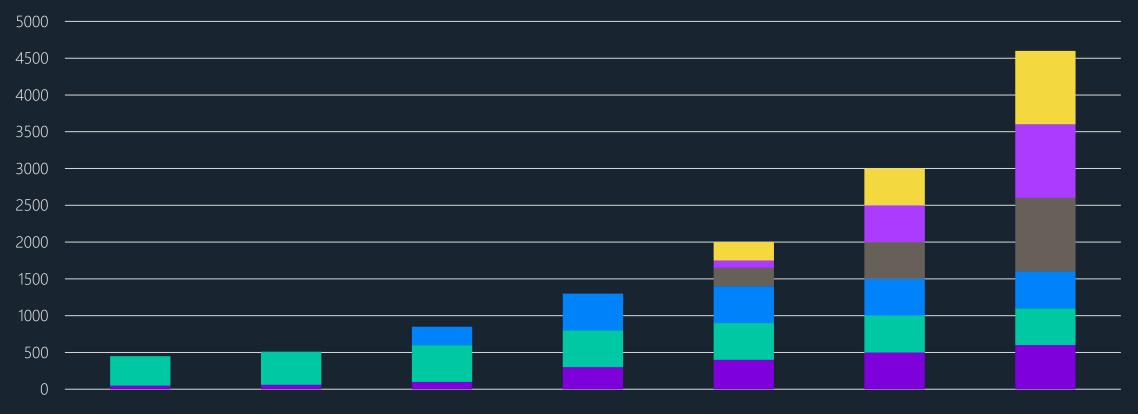

- When fully developed, the facility will employ more than 500 people and be among the largest electrolyzer manufacturing plants in the world
- The new facility will be built in steps to match supply with demand. Fully developed it will have a production capacity of up to 4GW Alkaline and PEM electrolyzers
- Michigan was elected based on an overall assessment of financial investment incentives, access to a highly skilled workforce, and cooperation with Universities and research institutions
- Short distance to Nel's collaborative partner General Motors, headquartered in Detroit, was also key to the decision of Michigan

PEM & ALKALINE capacity plan

Representative capacity buildout plan/[MW]

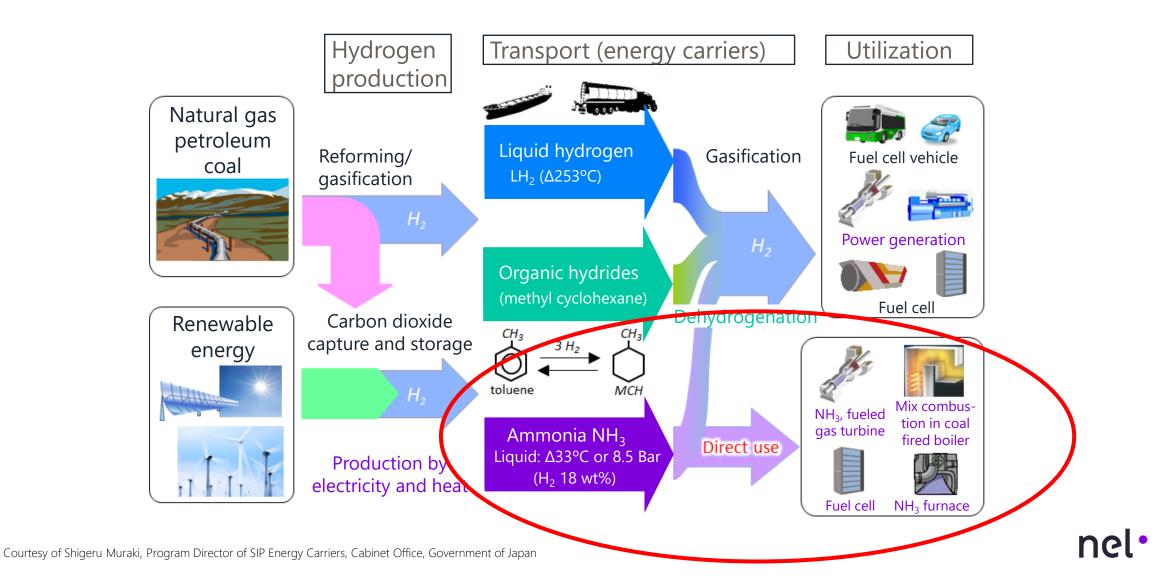

■ PEM W ■ ALK #1 ■ ALK #2 ■ ALK #3&4 ■ US GW PEM ■ US GW ALK

The energy transition requires pioneering customers and partners

11

Scheme of CO₂ free hydrogen value chains

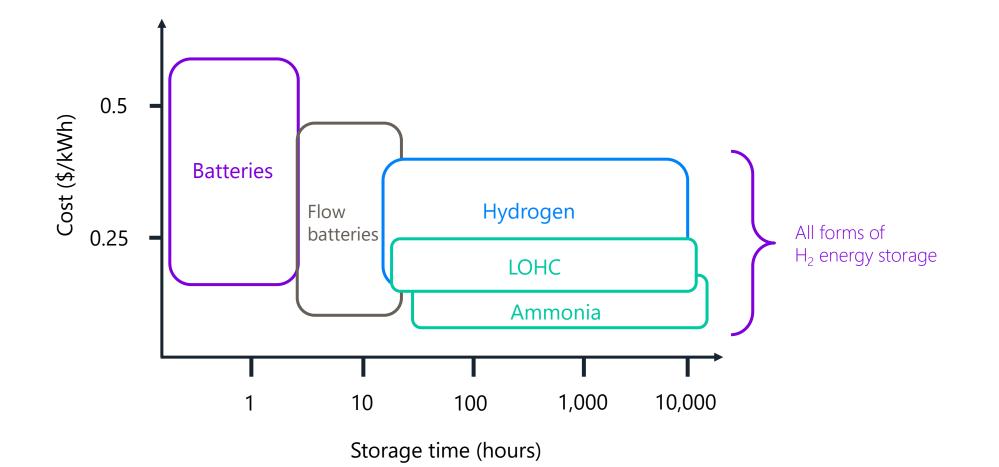

Why are we talking about ammonia?

- One of the largest industrial users of hydrogen
- A high-density carrier of hydrogen
- Easily cracked to liberate hydrogen at point of use
- Massive distribution infrastructure already in place
- Enables the storage and transport of renewable energy at a transformative scale (H_2 @scale)
- A promising and cost-effective vector for P2G
- Renewable hydrogen for ammonia production offers an opportunity to decarbonize both the energy and industrial sectors

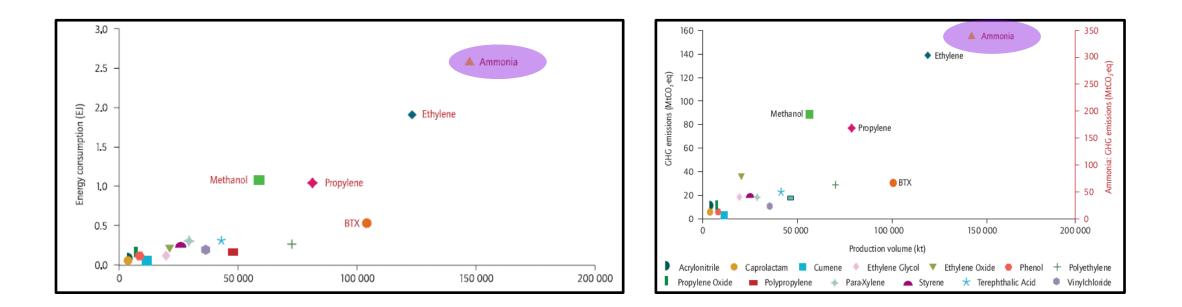

THE GREEN AMMONIA OPPORTUNITY

Levelized cost of energy storage

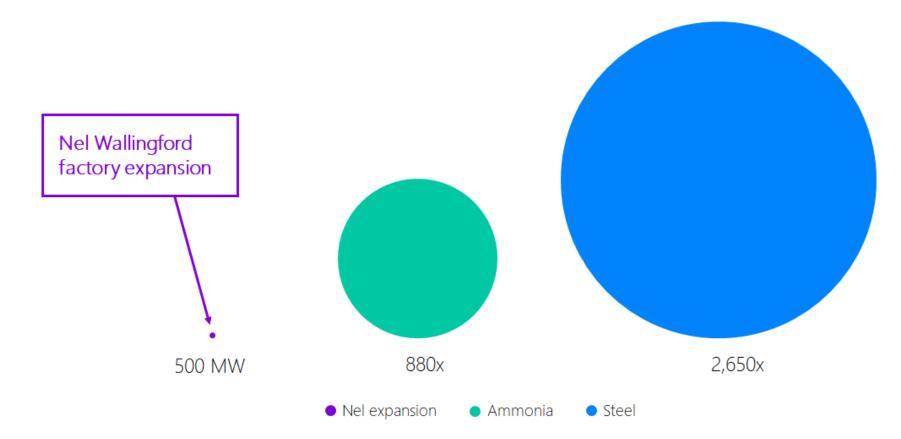

NH₃ impact: energy and GHG's

Ammonia is #1 out of 18 large volume chemicals for both energy use and GHG emissions, largely due to the H_2 reformation step from SMR

Market Outlook: A perspective on scale for just two offtaker markets

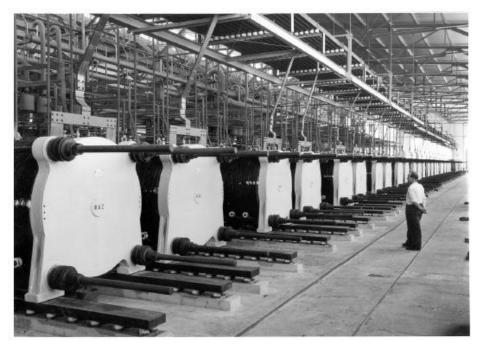

Renewable ammonia... the first to do it at scale

Rjukan, Norway 1927-1970's

- Two largest electrolyser plants worldwide
- Capacity: 30,000 Nm³/h each

Glomfjord, Norway 1953-1991

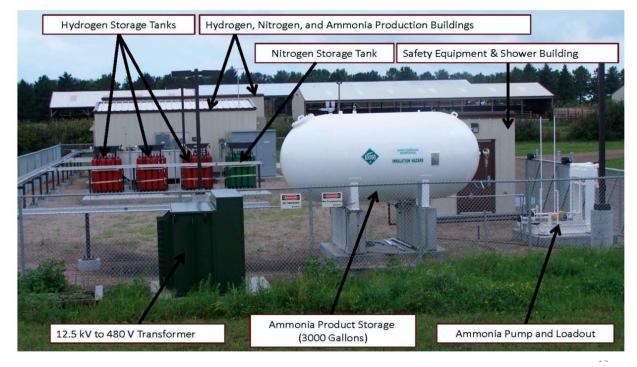

- Energy consumption: approximately 150 MW each
- Supplied by renewable hydropower

Distributed ammonia production in agricultural regions: green fertilizer where you need it, when you need it.

- Distributed ammonia plants need to be scaled to available renewable energy resources.
- Example: University of Minnesota's Zero-Emission Ammonia Pilot Plant, powered by an on-site wind turbine
 - •Pilot plant increasing to 1 ton/day in 2025
 - •Demonstrating capabilities of distributed ammonia plants
 - •Funded by ARPA-E REFUEL program
 - •Nel installing two new electrolyzers in the project for plant scale-up

Morris, MN Ammonia Pilot Plant

Scaled down conventional Haber-Bosch process, 25 ton/yr capacity

THE GREEN AMMONIA OPPORTUNITY

Iberdrola 20 MW PEM for green ammonia production

Iberdrola, one of the largest electricity utilities in the world, has, together with world-leading fertilizer manufacturer Fertiberia, launched a project to establish the largest green hydrogen plant in Europe (Spain)

- Project includes 100 MW photovoltaic plant, a 20 MWh battery and a 20 MW electrolyser
- Uses hydrogen to produce green fertilizer commencing in 2021
- Key lesson learned: Benefits a modular/skid-based approach to enable factory assembly/pre-testing and limiting on-site interconnection work

STRICTLY PRIVATE AND CONFIDENTIAL – ©2021 Nel – All rights reserved

THE GREEN AMMONIA OPPORTUNITY

REDDAP: The world's first dynamic green ammonia plant

- The world's first dynamic Power-to-Ammonia plant, using power directly from wind turbines and solar cells to produce green ammonia according to the amount of sun and wind
- Uses four Nel A485 Alkaline
 Electrolyzer systems having 10MW of electrolysis capacity
- The project is a demo plant, 1/100 of standard commercial ammonia plants
- Key lessons learned: TBD

Key Challenges

- De-risking large scale projectsCost of renewable energy
- Lack of government mandates/incentives
- Cost of electrolyzers

nel

Thank you!
